

**WHAT IS CLAIMED IS:**

1. A method for enhancing bolt fastening, the method being employed to improve fastening of a plate of a LCD module, the steps of the method  
5 comprising:

bending the plate so as to overlap a plurality of layers of the plate in a predetermined screw hole position; and

forming at least one screw hole in the predetermined screw hole position.

10 2. The method of claim 1, wherein the predetermined screw hole position is located on an upper, lower, or side edge of a frame.

3. The method of claim 1, further comprising a fastening layer applied in a gap between said plurality of layers of the plate.

15

4. The method of claim 3, wherein the fastening layer is a double-sided adhesive tape, an adhesive material layer, adhesive glue or plastic rings.

5. The method of claim 1, wherein the screw hole is forming by punching.

20

6. A bolt fastening structure employed to improve fastening of a plate of an LCD module, the bolt fastening structure comprising:

a plurality of layers of an overlapped plate; and

at least one screw hole formed through said plurality of layers of plates.

7. The bolt fastening structure of claim 6, wherein said plurality of layers of said overlapped plate are formed by bending the plate.

8. The bolt fastening structure of claim 6, further comprising at least one  
5 adhesive material layer disposed between the said plurality of layers of the plate.

9. The bolt fastening structure of claim 8, wherein the adhesive material layer is a double-sided adhesive tape, an adhesive material layer, adhesive  
10 glue or plastic rings.

10. The bolt fastening structure of claim 6, wherein the screw hole is forming by punching the plurality of layers of the overlapped plate.

11. The bolt fastening structure of claim 6, wherein the plate is a metal  
15 plate.
